IAS® has unveiled a new generation of cloud technology to address the complexities associated with planning, pricing, booking and executing inland container haulage. Developed as an extension to the industry-leading IAS DispatchManager, a web solution that automates the container haulage work order process from creation to proof of delivery, these latest solutions are designed to help ocean carriers, cargo owners, third-party logistics providers, and motor carriers connect and collaborate more effectively.

Intermodal road haulage is a vital link in the transportation chain, with significant impact on total shipment costs, efficiency and reliability. In the US, at least \$6bn is spent every year on container haulage. Yet all too often it is still a fragmented and manually-driven process, conducted largely one-to-one by phone, fax and email between the company originating an order and the motor carrier that fulfills it. The resulting poor information transparency gives little chance to optimize truck and container utilization across the many thousands of motor carriers serving import and export operations with limited first and last mile visibility.

Working together with the core DispatchManager system, the three new IAS modules – DispatchOptimizer, DispatchTender and DispatchTariff – represent a comprehensive response to these industry issues. The new solutions will be delivered via the IAS network, which includes over 1600 connected motor carrier offices in the US, along with thousands of other intermodal trading partners worldwide.

DispatchOptimizer is the next step forward in street-turn technology. Rather than operating outside the process, DispatchOptimizer leverages the existing DispatchManager solution to identify and ‘street turn’ intermodal transport hauls, reducing the significant costs associated with inefficient dual deadheading of empty import and export containers. Supported by visual mapping, saved dollar and miles calculations, automated equipment approval, authorization and status updates, DispatchOptimizer facilitates street turns, enabling originators and motor carriers to benefit from faster cargo pick-up and delivery, fewer empty miles, less queuing at ports, and better equipment utilization.

DispatchTender is a breakthrough neutral negotiation platform that allows originators to broadcast work to one or many motor carriers within their network. Motor carriers that receive offers may then place a bid for the work order. Respecting the economics and operational priorities of all parties, jobs are only assigned when both sides have signed off on the rate. As with DispatchOptimizer, all messages, approvals and rejections are communicated instantly, fully automating the negotiation processes. Motor carriers in the network get more visibility into possible jobs and a platform to win more profitable business, while originators gain access to possible one-way moves and a larger pool of motor carriers.

DispatchTariff is a centralized, automated rate management solution that streamlines the rate request and tariff maintenance process, reducing the burden and potential inaccuracies of manual administration. The new solution gives full rate visibility and control and allows both originators and motor carriers to reduce time and costs by establishing pre-approved tariffs for standard work order creation. It also provides a trusted benchmark for users to evaluate incoming work order quotes and the savings on optimized job orders.

“Major industry players including ACL, DHL, and NYK are already using DispatchManager to improve the cost, performance, environmental profile and final mile visibility of their intermodal container trucking operations,” said **Steve Dowse**, Chief Technology Officer for IAS. “IAS is excited to bring these new tools to the market to help the industry collaborate in tackling the common challenges of better resource utilization and service reliability, more cost and
